ANNUAL REPORT

OF THE

Medical Officer of Health,

FOR

1923.

Public Health Department, Bolton.

23rd July, 1924.

To the Chairman and Members of the Public Health Committee.

LADIES AND GENTLEMEN.

I have the honour to submit, in accordance with the instructions of the Ministry of Health, the Annual Report on the health of the County Borough of Bolton for the year 1923. The Report will be found to contain, in a condensed form, a very great amount of information regarding the health of Bolton during the period in question, and also its condition, from the health point of view, in 1923, as compared with that in previous years.

The death-rate in 1923, 12.8 per 1,000 inhabitants, is as low a death-rate as we have ever had in Bolton. It has only once, and that in 1921, been so low.

The infantile mortality, 85 per 1,000 births, is the lowest infantile mortality rate that Bolton has ever had. To those engaged in Maternity and Child Welfare work in the Borough this is an extremely gratifying fact.

No serious epidemic has occurred in Bolton during 1923. There was a moderate amount of scarlet fever, but in the great majority of cases it was of a very mild type.

No case of small-pox occurred in the Borough. Complete preparation was made to deal with any case that might arise.

I am very much indebted to the medical practitioners in Bolton for reporting to me cases in which a suspicion of small-pox was justifiable. All such cases were very carefully dealt with, and all of them proved not to be small-pox.

Tuberculosis shows a slight increase during 1923 as compared with 1922. I am satisfied however, that this increase is not real, but is only apparent, and is due to increased care and skill in the diagnosis of tuberculosis.

I desire once more to record my sincere appreciation of the loyal and able assistance I have received from the Deputy Medical Officer of Health, Dr. McKeague; the Assistant Medical Officers, Dr. Brown and Dr. Byrne; Mr. H. Hurst, the Public Analyst and Bacteriologist, from my Chief Clerk, Mr. Herbert Daniels, and from the whole of the staff of the Public Health Department.

I am, ladies and gentlemen, Your obedient servant,

C. W. PAGET MOFFATT,

Medical Officer of Health

and School Medical Officer.

STATISTICAL SUMMARY.

Population.

The mid-year population, as estimated by the Registrar-General, was 182 200. This is 500 less than the corresponding figure for the year 1922, and is exactly the same as the mid-year population for 1921. During 1923, births were 846 in excess of deaths. If the estimated population for 1923 is correct, Bolton must have lost during 1923 a total of 846 plus 500, or 1,346 inhabitants. This represents the adverse balance on immigration and emigration.

Marriages.

Information regarding marriages in the County Borough of Bolton is not obtainable.

Births.

Total births	 	 	3,189
Males	 	 	1,615
Females	 	 	1,574

Birth-Rate.

The birth-rate during 1923 was 17.5 per thousand inhabitants. In 1902 the birth-rate for Bolton was 28.1. For the ten years up to and including 1914 the average birth-rate was 24.3.

128 still-births were notified during the year.

Death-rate and Deaths.

The death-rate for 1923 was 12.8. No lower death-rate has ever been recorded for Bolton. The same death-rate was recorded in 1921.

Total deaths				2	,343
Males				1,148	
Females				1,195	
Excess of births	over	deat	hs		846

The total number of deaths includes 423 Bolton residents who died outside Bolton, and excludes 76 non-residents of Bolton who died in the town 68 of these non-residents died in the Bolton Infirmary.

333 Bolton residents died in Townleys Hospital.
48 ,, ,, Lunatic Asylums.

136 ,, ,, Bolton Infirmary.

1921	178,678				21.0	12.8	96

^{*} Borough extended in 1899.

The following table has been given every year, and for this reason I have decided to continue to give it. It must be noted, however, that no conclusions can be drawn from the figures for one year in the case of such small populations as those of most of the Wards. Thus the pulmonary tuberculosis death-rate for Heaton Ward is 1.2, whereas that of Hulton Ward is .2. In this year's table I give, in addition to the figures for 1923, the average figures for the years 1914-1923. These years include, of course, the abnormal years of the Great War.

Infantile Mortality.

273, or 11.6 per cent. of the total deaths were those of children under one year of age, an infantile mortality of 85 per 1,000 births. This is the lowest recorded in Bolton.

There were no deaths of children under one year of age in Heaton Ward. The highest mortality rate was 135, in East Ward.

The number of deaths of infants per thousand births during the first four weeks of life is called the neo-natal death-rate. The neo-natal death rate for Bolton during 1923 is therefore, 37.6.

Below is given the neo-natal mortality rate for Bolton for the 19 years up to and including 1923. It will be noticed that it does not vary very much. The neo-natal death-rate is mainly due to ante-natal conditions, and shows the need for ante-natal welfare work.

Neo-Natal Mortality-rate per 1,000 Births.

Year.			Rate.	Year.				Rate.
1905			46.8	1915				37.8

The maternal mortality per thousand births was 4.07 for Bolton during 1923. The corresponding figure for England and Wales for the same period is 3.78. The Bolton figure compares very favourable with other industrial towns.

Mortality from Epidemic Diseases.

73 deaths were registered from the seven chief epidemic diseases. This is equal to a death-rate of $\cdot 40$.

The cancer death-rate in Bolton in 1923 was 1·17 per 1,000 inhabitants. The death-rate from tuberculosis of all forms was 1·11.

The ravages of cancer are so terrible that from the practical point of view we may disregard the question of its increase, although I am of opinion that all the evidence available leads inevitably to the conclusion that cancer is increasing.

It is of extreme importance that the public should be aware of the following facts:—

- (1) Cancer causes at first no pain.
- (2) Cancer usually occurs after the age of 35. Any unusual lump or swelling occurring in a person over 35 should cause medical aid to be sought at once. This applies also to any unusual bleeding or discharge.
- (3) Cancer taken at an early stage can usually be cured by operation which involve no risk to life. In a minority of cases radium and X-rays are useful. The bait "Cancer cured without operation" is practically always a bait held out by fraudulent persons.

During 1923 the Ministry of Health's Circular 426, dealing with cancer, was sent by this department to every medical practitioner in Bolton.

950 leaflets on cancer in women published by the Central Midwives Board were distributed at the Bolton infant clinics and short addresses were given impressing on the mothers the importance of getting early medical advice.

For the comfort of certain people who suffer great anxiety by reason of erroneous popular beliefs regarding cancer I take this opportunity of saying as definitely and as emphatically as possible

- (1) That there is no evidence that there are such things as "cancer houses."
- (2) That there is no evidence that cancer is infectious.
- (3) That there is no evidence that cancer is hereditary.

SECTION II.

Infectious Diseases, Venereal Diseases,

AND

Hospital Isolation.

Notifiable Infectious Diseases.

The infectious diseases notifiable in Bolton are: Small-pox, cholera, plague, diphtheria, membranous croup, erysipelas, scarlet fever, ophthalmia neonatorum, acute poliomyelitis, cerebro-spinal fever, tuberculosis, acute polio-encephalitis, encephalitis lethargica, acute primary pneumonia and acute influenzal pneumonia, malaria, dysentery, and the fevers known by any of the following names: typhus, typhoid, enteric, relapsing, and puerperal.

There were 978 cases of infectious disease in Bolton in 1923. This does not include tuberculosis, which is dealt with separately. The corresponding figure for 1922 was 864. The increase is due to a larger number of cases of scarlet fever.

SMALL-POX.

No case of small-pox occurred in Bolton in 1923. There were several cases which aroused a suspicion of small-pox, but fortunately in every case the suspicion proved unfounded. During 1923 a copy of Wanklyn's pamphlet on the "Diagnosis of Small-pox" was sent by me to every medical practitioner in Bolton. All the inspectors were supplied with typewritten instructions showing in detail what to do should a case of small-pox occur. On four occasions notices were inserted by me in the local papers advising vaccination and giving the addresses of the Public Vaccinators.

SCARLET FEVER.

There were 642 cases of scarlet fever notified during 1923, the incidence rate of the disease constituting a mild epidemic. Of the cases notified 373, or 58·1%, were admitted to hospital. There were six deaths from scarlet fever, of which two took place in hospital. The great majority of the cases were of a mild type. The attack rate was 3·52 per thousand persons living. The rate for England and Wales was 2·23.

Mortality rate per 1.000 inhabitants in 1923 and previous years:

	,	1	,					1		
	1914	1915	1916	1917	1918	1919	1920	1921	1922	1923
Bolton England and	0.01	0.02	0.05	0.04	0.01	0.02	0.01	0.03	0.02	0.03
Wales	0.08	0.06	0.04	0.02	0.03	0.03	0.04	0.03	0.04	0.03

The mortality rate per 100 cases was .93

DIPHTHERIA.

84 cases were notified of which 10 died. This gives a death-rate per hundred cases of 11.9. 45 cases, or 53% of the whole number were removed to hospital. Of the cases removed to hospital four died.

Mortality rate per 1,000 in previous years :-

	1914	1915	1916	1917	1918	1919	1920	1921	1922	1923
	0.25	0.26	0.11	0.13	0.16	0.34	0.18	0.11	0.07	0.05
England and Wales	0.15	0.15	0.14	0.13	0.14	0.13	0.15	0.12	0.11	0.07

ENTERIC FEVER.

Four cases of enteric fever were notified, of which two were admitted to hospital. There were no deaths. Four cases of suspected enteric were admitted to hospital. One was found to be suffering from influenza and one from simple enteritis. Two did not from the time of admission to hospital, show sign of any disease. All were discharged in good health. 1923 is the only year of all the years of which we have any records, in which there were no deaths from typhoid in Bolton.

Mortality rate per 1,000 in previous years:—

	1914	1915	1916	1917	1918	1919	1920	1921	1922	1923
Bolton England and	0.06	0.10	0.05	0.04	0.03	0.02	0.03	0.01	0.01	0.00
Wales	0.05	0.04	0.03	0.03	0.03	0.01	0.01	0.02	0.01	0.01

ERYSIPELAS.

There were 56 cases notified, of which cases four died, a fatality of 7.1%. Record of previous years:—

	1914	1915	1916	1917	1918	1919	1920	1921	1922	1923
Cases Deaths Fatality per	90	148 6	87 4	54 2	46 1	87 3	78 7	87 2	50 6	56 4
cent.	3.3	4.0	4.5	3.7	2.1	3.4	8.9	2.2	12.0	7.1

It is extremely doubtful whether anything is gained by retaining erysipelas on the list of notifiable diseases.

OPHTHALMIA NEONATORUM.

32 cases were notified. Of these, II were treated at home and 21 attended the Bolton Infirmary as out-patients. Two cases died, one aged one month, the other aged four months. The cause of death in the first case was general debility; in the second case, gastro-enteritis. In one case there was loss of

vision in one eye. In this case the child was treated at the Infirmary as an out-patient and was discharged as cured. After being discharged it relapsed, and was then admitted as an in-patient.

Notification of Ophthalmia Neonatorum during the past seven years were as follows:—

			1917	1918	1919	1920	1921	1922	1923
Number of cases Rate per 1,000 births	 • •	• •	23 8·4	16 5·8	41 13·4	51 12·1	35 9·1	21 6·1	32 10·0

Of the cases notified, 28 were delivered by midwives, and 4 by doctors.

In 1922 twenty-one cases were notified and there was no impairment of vision in any case. Two cases died; one of marasmus, and the other of broncho-pneumonia. The increase in notifications this year is, I think, explained by the fact that I have impressed on the midwives that where there is any suspicion of slight inflammation, the case must be notified.

PUEPERAL FEVER.

3 cases were notified. They all died. Further particulars concerning them are given under Maternal Deaths.

MALARIA...

One case was notified: there were no deaths.

ENCEPHALITIS LETHARGICA.

Three cases were notified, and there were no deaths. There may well have been more cases as, the disease being unfamiliar, many cases were undoubtedly missed. This is probably especially true of those mild cases in which the symptoms are almost entirely ocular.

CEREBRO-SPINAL FEVER.

One case was notified. It recovered.

ACUTE POLIO-MYELITIS.

One case was notified. There were no deaths.

Infectious Diseases not Notifiable.

Measles.

There were only 4 deaths from measles. The number in 1922 was 63.

INFLUENZA.

There were 94 deaths from influenza as compared with 122 in 1922. The following table shows how these deaths were distributed throughout the year:—

_
2
4
5
6
94

Record of previous years :-

Tuberculosis in Bolton in 1923.

The number of Bolton residents who died in 1923 of tuberculosis of all forms was 204. Of these 157 died of pulmonary tuberculosis and 47 of non-pulmonary tuberculosis. This gives a tuberculosis death-rate of 1·11 per thousand inhabitants, a slight increase on the death-rate for 1922, which was 0·96.

Of the tuberculosis deaths the following took place in institutions:-

PULMONARY TUBERCULOSIS.

14 residents died in Institutions in Bolton:-

9 in the Borough Hospital;

4 in Wilkinson Sanatorium; and

1 in Bolton Infirmary.

45 residents died outside the Borough:-

37 in Townleys Hospital;

6 in Lunatic Asylums (5 in Prestwich and 1 in Lancaster.);

I in the Infirmary, Evington;

1 in Ludlow.

Non-pulmonary Tuberculosis.

7 residents died in the Bolton Infirmary.

Localization of tuberculosis:-

1 Neck;

1 Hip;

1 Ribs:

2 Peritoneum;

1 Spine and Meninges;

1 Mesenteric glands.

11 residents died outside the Borough:-

9 in Townleys Hospital;

I in Lancaster Asylum;

1 in Salford Royal Hospital,

Phthisis (Pulmonary Tuberculosis).

There were 157 deaths, a death-rate of .86 per 1000 inhabitants.

Age and sex of persons who died of pulmonary tuberculosis:-

Notification of Tuberculosis.

Of the 204 Bolton residents who died of tuberculosis of all forms, 28, or 13.7% were not notified before death.

The reasons for the higher percentage in previous years of deaths from tuberculosis of persons not previously notified were as follows:—

Where cases were referred to the tuberculosis dispensary by private practitioners and were found to be tuberculous, they were entered on the dispensary records as tuberculosis patients, but no steps were taken to secure a formal notification from the doctor.

Information obtained from "C" and "D" form notifications were not regarded as notifications in our records.

Of the 28 deaths from tuberculosis of persons previously unnotified five took place in Townleys Hospital and no trace of them could be found at the addresses where they were said to have resided before admission; four took place at the Bolton Infirmary; and one at Prestwich Asylum. In several of the remaining cases the diagnosis of tuberculosis was only made very shortly before death.

1922	 	135	138	80	40
1923	 	133	157	60	47

Non-pulmonary Tuberculosis was not compulsorily notifiable until 1913.

Tuberculosis Dispensary.

The tuberculosis dispensary, of which Dr. John McKeague is the Medical Officer, works in cordial co-operation with the medical profession of Bolton. Cases are freely referred to it for consultation. For such special treatment as are given at the dispensary there is no difficulty whatever in securing the regular attendance of the patients.

All tuberculosis patients who have been in touch with the dispensary and who are not in residence at institutions attend regularly at the dispensary for supervision. Cases too ill to attend the dispensary are visited by the Tuberculosis Nurse.

The number of attendances at the dispensary made by patients in 1923 was as follows:—

Insured persons Uninsured persons	 • •	 1654 atter 1921	ndances.
Total attendances		3575

Borough Hospital		56	57
Townleys Hospital		1	3
Infirmary		19	20
Heswall (Children's Hospital)		2	2

Early in the year we ceased to send any cases of tuberculosis to Townleys Hospital. At the Wilkinson Sanatorium we pay for a minimum of 15 patients, but we have had the privilege of sending up to 20 patients without any further charge. In 1924 we shall pay, at a reduced fee, for 20 beds, but we shall have the privilege of sending up to 30 patients, paying as per user for all beds occupied over 20.

The results obtained at the sanatoria to which Bolton patients are sent are as good as those obtained elsewhere. Sanatoria are the best treatment available for pulmonary tuberculosis. They are indispensable, and it is foolish to decry them because the results obtained are not all that could be desired. We have up to the present no treatment comparable in efficacy with sanatorium treatment.

4. Malt and oil given			 	 	 150-lbs.

Venereal Diseases.

It is impossible to estimate the amount of venereal disease in Bolton and throughout the country generally. That it is considerable is proved by the following facts:—

- (1) A large number of cases of disease of the heart, blood vessels, and nervous system occurring during middle age are definitely known to be due to an earlier infection with venereal disease.
- (2) A very great deal of the mental disease affecting the inmates of asylums is known to be due to the same cause. These cases cost the rate-payer large sums of money.

The public generally has no idea of the good work done by the Venereal Disease Clinics established throughout the country during the last few years. I am convinced that no agency at work in this country has done so much in the same time to stamp out disease as these clinics. Any case of syphilis can in a few days be made non-infectious, so that he ceases to be a danger to those who come in contact with him. Much more prolonged treatment is needed to secure him against the consequences to himself and to his offspring of the disease. But the fact that he is made incapable of spreading the disease to others must in a few years show very satisfactory results—for hitherto, a very large number of those suffering from venereal disease were innocent victims.

Very misleading statements are often made as to the number of patients who cease attendance at venereal disease clinics before treatment is complete. It is very rare for any patient suffering from syphilis to cease attendance before becoming at least non-infectious to others. The tests of cure are now much more searching and more definite than they were some years ago. The great majority of those who are said to discontinue treatment before the cure was complete have, as a matter of fact, put in a large number of attendances, and would formerly have been regarded as being completely cured.

It should be generally known that treatment at the venereal disease clinics in Bolton and elsewhere is free to all, without limitations as to nationality place of residence, age, sex, or income. It is necessary to emphasise this, as there appears to be some misapprehension on the subject.

Clinics are held at the Treatment Centre established in the Public Health Offices at the following times:—

Monday	 	 	7-0 p.m.)
Monday Tuesday	 	 	7-0 p.m.	Males.
Wednesday	 	 	7-0 p.m.	J
Thursday Saturday	 	 	7-0 p.m.	Famalaa
Saturday	 	 	11-0 a.m.	Circinales.

Patients who are unable to attend the evening clinics can receive treatment during the day by arrangement. Every case which calls for the first time at the Public Health Office receives whatever treatment may be necessary the same day.

Irrigation of cases of gonorrhœa is carried out at the following times:—

All specimens for the Wassermann test and some other specimens are sent to Professor Topley at the Public Health Laboratory, York Place, Manchester.

The supply of Salvarsan and its substitutes to medical practitioners, and the examination of specimens sent by them is carried on in accordance with the instructions of the Ministry of Health.

149 doses of Salvarsan substitutes were supplied to 10 medical men. 134 samples of blood and 7 smears sent by private practitioners were sent to Manchester for examination.

The following table shows the number of Bolton patients who were dealt with at Treatment Centres in other towns.

Died in 1923	2		4	9		1	16
Remaining, Dec. 31st, 1923	19		••	23			42

The total number of patients treated in the scarlet fever wards during 1923 was 373 admissions, together with 49 patients in hospital at the beginning of the year, a total of 422. Of these patients 2 died. All of the 19 patients in hospital at the close of the year made a good recovery. The case mortality was therefore 0 47 per cent. Of the patients who died, one died six hours after admission. The other was very ill on admission, and died on the third day from admission.

Of the patients admitted as scarlet fever, 2 were found to be suffering from diphtheria only, and 4 from scarlet fever and diphtheria. These all made a good recovery. 4 were found to be suffering from German measles, and in the case of 4 there was no evidence from the time of their admission of any disease whatever.

The prevailing type of scarlet fever was so mild that in the case of several patients it was impossible to say definitely whether they had scarlet fever or not.

There were several cases of a severe type. In these cases anti-strepto-coccic serum was given with apparently great benefit.

Two probationer nurses contracted scarlet fever. They made a good recovery. They are included in the admissions.

The complications which developed in scarlet fever patients were as follows:—

Nephritis	 		 	 2
Albuminuria	 		 	 15
Rheumatism and arthritis	 		 ٠.	 19
Glandular abscesses	 	٠.	 	 6
Otitis media				
Secondary adenitis	 		 	 42
Septic sores				
Rhinorrhæa				
Endocarditis	 		 	 3
Thrombosis of femoral vein	 		 	 - 1

As far as could be judged on examination for discharge a complete recovery had been made from the above complications.

8 return cases of scarlet fever were admitted during 1923. Cases occurring within four weeks after the date of discharge of a patient are reckoned as return cases. It is of course, by no means certain that these cases were infected by patients discharged from the hospital.

The average period in hospital of patients suffering from scarlet fever was 37 days.

Of the patients admitted as diphtheria 2 were found to be suffering from follicular tonsillitis, 1 from septic perichondritis, 1 from influenza, 1 from simple laryngitis, 1 from scarlet fever, and 1 from Vincent's angina.

Four patients suffering from diphtheria died in hospital. One of these died after tracheotomy. On one other patient tracheotomy was done and the patient recovered.

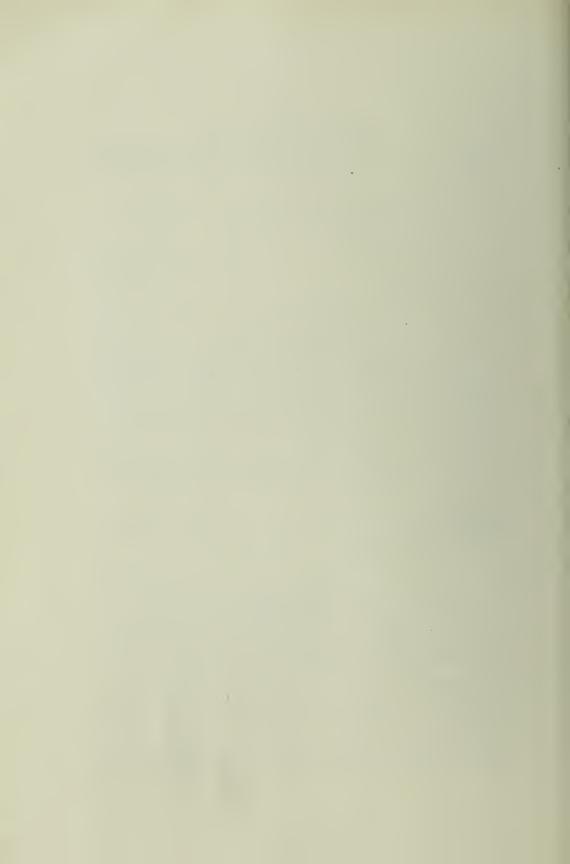

The average stay in hospital of diphtheria patients was 41 days.

Six patients were admitted as enteric. Of these one had simple enteritis, one had influenza, two showed no signs of enteric from the time of admission, and two had enteric fever. All were discharged in good condition.

During 1923 electric lighting was installed in the large scarlet-fever wards, in the typhoid and diphtheria wards, and in the Eastern Hospital Administrative Block. During 1924 the installation of electric lighting in all remaining parts of the hospital will be completed.

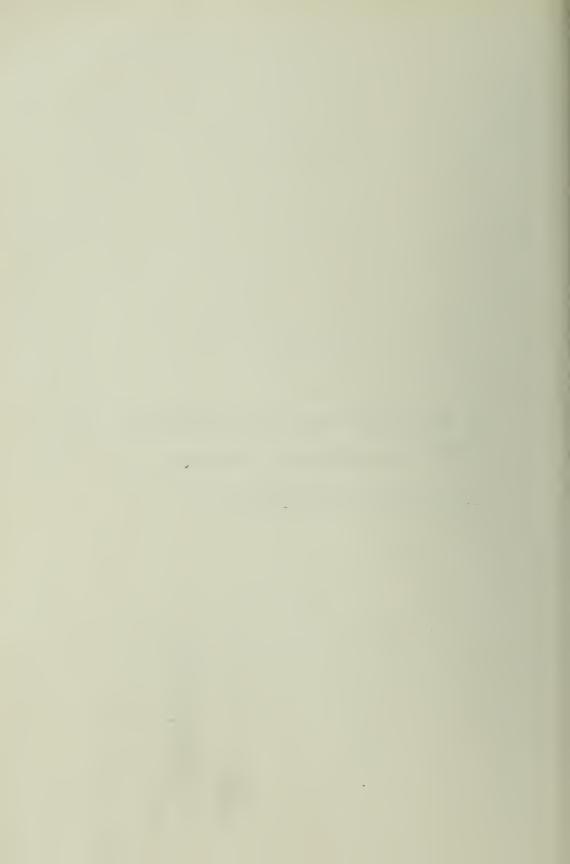

The health of the staff, nursing and domestic, was good throughout the year. Two of the probationers contracted mild scarlet fever. There were several cases of mild influenza. There was no other serious illness.

I desire to place on record my high appreciation of the ability and care which the Matron, Miss E. Bateman, has now for many years given to the welfare of the patients and staff at the Bolton Borough Hospital. Thanks are also due to the nursing and domestic staff for their loyal co-operation.

School for Mothers and Infant Clinics.

The work done by the above organisation is most encouraging. The co-operation between the Bolton Public Health Authority and the School for Mothers, a voluntary organisation, is thorough and cordial. I feel greatly indebted to the voluntary workers who perform their duties with an enthusiasm, a punctuality, and an efficiency deserving the highest praise,

They are instrumental in getting a great amount of work done at very little cost. The infant clinics at which the consultations take place are staffed and controlled by the Medical Officer of Health. The Medical Officers are now whole-time Medical Officers of the Public Health Department.

There are eight centres, each of which is open once a week. The attendances at these centres have been well maintained. Mothers are encouraged to bring their children at the earliest age possible, and the object aimed at is the prevention of ailments by proper feeding, etc., rather than the cure.

Of the 1,371 babies enrolled during 1923, the ages at the time of enrollment were as follows:—

The figures given below are from April 1st, 1923, to April 1st, 1924. In future the figures will be for the calendar year.

	one month			244
,,	two months	 	 	 264
	three months			
11	six months	 	 	 236
	twelve months			195
	months and o			187

Children are admitted up to five years of age. There were 10 sets of twins, and 571 were first babies.

Each Centre is open one half-day per week. The number of babies' attendances at the different Clinics and Centres from April, 1923, to April, 1924, has been as follows:—

			New Members	No. on Roll	Total Attendances	Meetings	Average
1. Tipping Street	 		185	225	1962	46	42.6
2. Daubhill	 		231	260	2454	45	54.5
3. Halliwell	 	٠.	258	301	2414	43	56·1
4. Grecian Street			150	188	2094	46	45.5

6. Pikes Lane	 		167	208	1 7 04	46	3 7 ·0
7. James Terrace	 	٠.	132	141	1422	46	30.9
8. St. Chad's	 		62	99	800	46	17.3
			1371	1677	14843	364	327 · 2

PRE-NATAL WORK.

Expectant mothers are encouraged to attend all the clinics where they are advised by the doctor. A special class for expectant mothers is held once a week. 180 expectant mothers attended this class during the year, and the attendances numbered 730.

MASSAGE.

Arrangements have been made and are now working for suitable cases attending the infant clinics to receive massage. This treatment is given at Flash Street School twice a week by one of the voluntary helpers who is a fully-qualified masseuse.

VISITS PAID BY NURSES.

The School for Mothers pays two trained nurses who give their whole time to the work. This work is most useful in following up and supervising cases attending the clinics. These nurses paid 3,075 visits during the year. Their work is so co-ordinated with that of the health visitors that no overlapping takes place.

The Catholic Women's League conducts two infant clinics which are attended by private medical practitioners.

Bolton Day Nursery.

The Bolton Day Nursery is managed by a voluntary committee co-operating with the Public Health Authority from which it receives a grant of £300 a year. It is under the general supervision of the Medical Officer of Health. It has a medical officer who attends weekly and at any time when required.

This institution has now an honourable and recognised position in the social work of the town. It is undoubtedly a very great boon to a large number of mothers who are compelled by sheer necessity to go out to work. Children are cared for from 7-0 a.m. to 5-30 p.m. from Monday to Friday, and on Saturdays from 7-0 a.m. to 1 p.m. A charge of 1/- per day is made. On Saturdays the charge is 6d.

The institution is undoubtedly greatly appreciated, a fact vouched for by the attendances. The attendances during 1923 numbered 9,104, an increase of 3,368 attendances on those made in 1922.

The institution has been singularly free from sickness, infectious and non-infectious, during the year.

Haslam Maternity Home.

This institution has done good work during the year. The total number of admissions was 254. It is greatly appreciated by the patients and at the time of writing (14.6.24) the applications for admission are rapidly increasing. Very few cases indeed have been refused admission. Inability to pay the fee asked has never been made a reason for refusal; but cases whose only claim is destitution are referred to the Poor Law Authority.

Patients can choose any doctor they please to attend them. When no choice has been made the Matron sends for one of the medical men who have agreed to attend at the fees prescribed by the Ministry of Health. The Home is visited daily by the Maternity and Child Welfare Medical Officer, and all cases on the admission list are seen at intervals unless their own doctors desire to do this themselves.

No maternal deaths took place during the year.

The increase in patients, which I confidently anticipate, will render necessary before long the provision of a more suitable laundry than that now in existence.

Full particulars of all cases admitted to the home during 1923 are given below :—

2835 cases out of a total of 3306 births were attended by midwives.

The Local Authority neither employs nor subsidises any practising midwives.

Cost of Medical Aid sent for by Midwives in 1923.

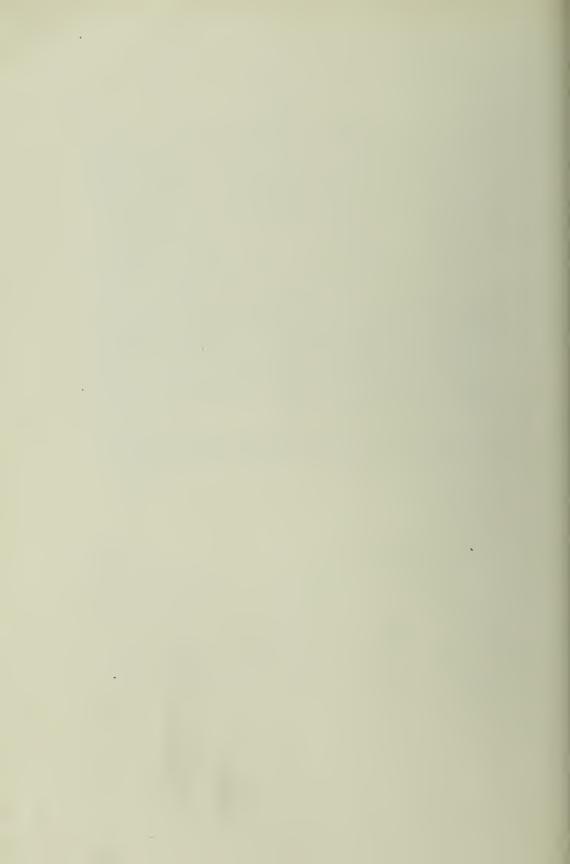

No. of calls for Medical Aid	390)
No. of Doctors' fees payable by Local Supervising Authority	88	3
Gross amount paid by Local Supervising Authority £153	1 6	5
No. of such fees or part thereof recoverable from patients	14	1
Amount recoverable from patients £18	12	5
Net amount to be paid by Local Supervising Authority for		
Medical Aid to Mothers and Infants at time of confinement £134	9 ()

The midwives show themselves, with very few exceptions, most ready to carry out loyally the instructions of the Public Health Department. The inspection of the midwives is now mainly carried out by Dr. Evelyn Brown, the medical officer engaged in maternity and child welfare work. In all cases, however, when there appears to be any failure to comply with the regulations of the Central Midwives' Board the midwife in question is asked to attend at the Public Health Office and is interviewed by me.

The recovery from patients whose income justifies such recovery of fees paid for medical aid summoned by midwives is a matter of extreme difficulty

in Bolton, as apparently everywhere else.

It is my intention to organise in 1924 a course of lectures for midwives. I know that such a course would be very much appreciated by the midwives, and would prove most useful.

FARM VISITATION.

No. of farms visited .	 	 	 	 20
cows examined				521

Owing to the prevalence of foot and mouth disease in close proximity to our district, farm visitation has been partially suspended.

Contagious Diseases of Animals.

FOOT AND MOUTH DISEASE.

No outbreak of this disease occurred within the borough. In respect to outbreaks in districts adjoining Bolton, a number of regulations were made by the Ministry of Agriculture and Fisheries requiring the issue of licenses by this department for the movement of animals.

PARASITIC MANGE.

Two suspected cases of this disease were reported, but on investigation both cases were found not to have parasitic mange.

Rats and Mice Destruction Act, 1919.

Close attention has been paid to the requirements of this Act. Visits have been made to infested premises and advice given to the occupiers. During Rat Week literature was forwarded to all persons interested, viz., farmers, corn merchants, butchers, etc., advising them as to the best methods for exterminating them.

The American Gooseberry Mildew Order of 1912.

Careful inspection has been maintained for any evidence of this disease, but during the year no cases have been detected within the Borough.

Sale of Food and Drugs Acts.

MILK.

Total examined. Genuine, Adulterated.

The samples were all examined for the presence of preservatives and colouring matter, in all cases the result was negative.

The average composition of the milk supply (exclusive of skimmed) for the borough was:—

Milk Fat.	Non-fatty solids.	Water.
3· 7 0	8.92	87.38 per cent.

Considering the majority of the milk is produced locally, this is quite satisfactory for a manufacturing district.

The quality of the milk supply throughout the year is shown in the

Mon	abic.			No. of samples.	Milk Fat.	Non-fatty- solids.
January	 			29	3.36	8.98
February	 			9	3.68 3.41	8.89 8.87

December	 	٠.	٠.	24	3.69	8.86

BUTTER.

Of the 52 samples examined, all proved to be genuine and of good quality. In no case was foreign fat incorporated, nor was the maximum limit for water or Boric Acid exceeded.

MARGARINE.

27 samples were examined, of these 1 was adulterated, this, however, contained only 0.4 per cent. of water in excess of the maximum. Beyond noting the fact, no other comment was deemed necessary.

TEA.

Rather more samples of tea have been taken this year than usual. As retailed, tea is rarely found to be adulterated, the examination being conducted by the Customs. However, occasional samples are desirable as adulteration with baked cereals has been detected in this Borough (vide earlier reports).

COFFEE AND COFFEE MIXTURES.

Twenty samples were submitted for examination. These, allowing the trade convention of French Coffee as a mixture of Coffee and Chicory, were all genuine.

Samples of French Coffee submitted contained 41.9 per cent. Chicory.

Cocoa.

In view of the scare of arsenic in cocoa, the principal brands were examined for the presence of this adulterant. In no case did the amount of arsenic exceed 1/200 grain per lb.

I think it may safely be assumed that the presence of arsenic found in the samples of cocoa by the County Analyst for Surrey was purely accidental and unlikely to recur.

Drugs.

11 Samples were submitted during the year, 9 of these were of good quality, satisfying, where such existed, the B.P. standard of purity.

2 samples of Calcined Magnesia were unsatisfactory, legal proceedings being instituted in the case of the official sample (see Adulterated Samples for offence).

All samples, where necessary, were examined for the presence of preservatives.

MEAT PRODUCTS.
Containing
Preservative.
12

Per cent. of Preserved Samples.

These figures indicate the practice is very general, although in no case was the suggested limit (17.5 grs./lb. Boric Acid) exceeded.

Prescriptions examined under the National Insurance Scheme. 28 prescriptions were examined to determine the accuracy of the dispenser, the results are formulated in the following table.

I am of opinion that the error should not exceed 10% in the case of ordinary non-poisonous drugs, but in the case of powerful specifics the error should be much less than this, and each should be considered on its merits.

MISCELLANEOUS EXAMINATIONS (99) of varied character have been undertaken for various Departments of the Corporation.

For the M.O.H. ... 16 Milks for Bacteriological Examination.

6 Waters for purity.

7 Effluents to determine whether or not such effluent constitutes a nuisance, or if such effluent is suitable for turning into a stream.

5 Mussels for cleanliness.

4 Urines.

5 Drugs for purity.

11 Shaving Brushes for Anthrax.

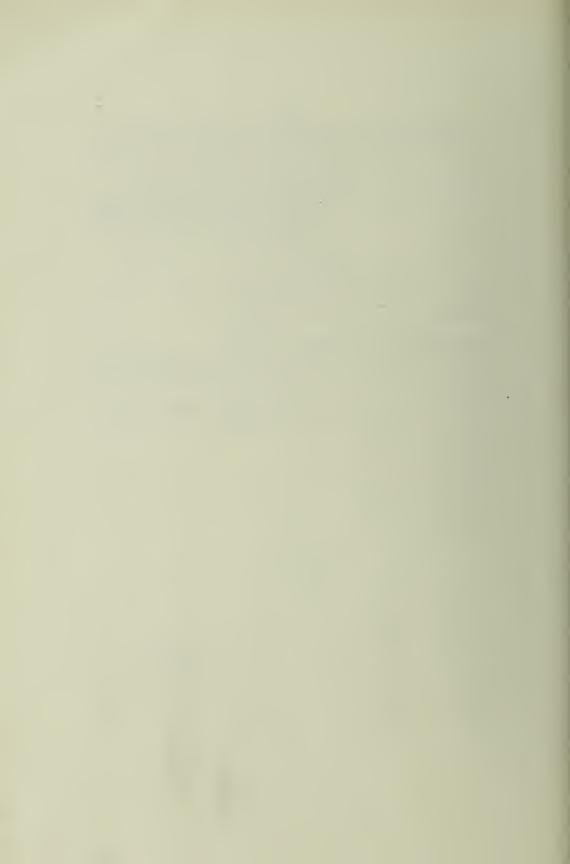

For the Police 6 Samples of Beer.

", ", Chocolates.

For the Scavenging Dept. 1 Sample of Fish Meal.

For the Water Engineer .. Investigations on Precipitants and on problems arising from water matters such as stains on materials, etc.

For the Coroner Examination of Medicine to determine accuracy of the dispensing.

Housing.

The housing question attracts, and quite justly, so much attention that the following figures will be found instructive and interesting.

	1901	1911	1921	1923
Population	168215	180851	178683	182200
Inhabited houses	35995	40550	41828	43605
Uninhabited houses	1624	1325	647	299
Population per house	4.6	4.3	4.27	4.19
Persons per room	—-;	—-;	· 98	
Rooms per person	—-;	—-;	1.01	
Persons per family	4.65	4.39	4.13	
Married male population	28553	32446	35951	
Married female population	29241	33558	36544	
Percentage of population consisting of				
married males	16%	17%	20%	
Percentage of male population married	36%	38%	43%	
Percentage of female population married	32%	35%	38%	
Widowed male population	2505	2897	3045	
Widowed female population	6544	7106	7895	

The following facts are made evident by the above figures:-

- (1) The population per house was, in 1923, less than at any previous time in Bolton of which we have records.
- (2) The shortage of houses is due to the fact that since the conclusion of the Great War the population of Bolton contains a much larger percentage of married people than at any previous period. The shortlived boon at the close of the war was probably its cause of the unusual number of marriages. It was a temporary factor, and its force is diminishing every year.

Attention is drawn every now and then to cases of over-crowding in Bolton, and many people infer that such cases are specially striking instances of an overcrowding which is general throughout the town. Such an inference is entirely wrong. The population as a whole has more house room than it ever had before; but family groups find it much harder to get houses than they did before the war. This is the sense in which there is a house shortage in Bolton. Cases of overcrowding will occur here and there no matter how many houses are provided.

Nothing in these remarks must be taken to mean that more houses are not required. They are required, and very badly. It is very bad for married couples to have to live in someone else's house.

How many houses are needed? I do not know. No one knows. When another thousand houses have been provided it will perhaps be worth while endeavouring to make a fresh estimate.

C. Proceedings under section 17 and 18 of the Housing, Town	
Planning, &c., Act, 1909	

Closet Accommodation.

The replacement of privy middens by fresh-water closets has proceeded most satisfactorily during 1923. The number of these conversions during 1923 has been nearly double that of any previous year. The grant in aid made by the Corporation has proved most useful, and the work has been carried out with very little friction. It would be difficult to over-estimate the gain in comfort to the inhabitants from these conversions.

During the year 1923 there were 1,011 conversions of privy-middens or pails into fresh-water closets in the Old Borough and 560 in the Added Area, a total of 1,571 fresh-water closets provided in 1923.

From 1899-1923 inclusive, 12,482 closets have been converted at a cost to the Corporation of £27,306, and replaced by water-closets, and 330 privy middens and pails have been demolished. In new houses during the same period, 9,313 water-closets have been provided.

The present number of privy-middens and pails as compared with those of 1898 are :--

Common Lodging Houses.

The number of registered houses in the Borough is 38, providing accommodation for 1,231 persons, as compared with 57 houses, providing accommodation for 1,571 persons, in 1914.

Routine inspections are made weekly and periodical visits are paid at midnight when the lodgers have retired for the night.

The distribution of the houses is as follows:-

Wa	ard.			Houses.	Rooms.	Beds.
Exchange	e	 	 	13	 75	 265
East		 	 	19	 113	 589
Church		 	 	4	 41	 270

Smoke Abatement.

There are 250 factory chimneys in use in the Borough.

During the year, 601 half-hour observations were taken, and on 14 occasions the period of permissibility was exceeded. The local standard period of permissibility (fixed by the Council in 1906) is two minutes' black smoke in the half-hour or four minutes in the hour. 13 notices of abatement were served.

Last year (1922), 512 half-hour observations were taken, resulting in 13 nuisances being reported, one firm being summoned before the Justices, who imposed a fine of £10.

The following are the details of the smoke observations during 1923:-

T	210	1 10 1	1 .*

There are 44 slaughterhouses in the Borough. Of this number, 28 are private slaughterhouses and 16 at the Public Abattoirs.

Of the 28 private slaughterhouses, 8 are not used at all or are only used, occasionally, and at the Public Abattoirs 1 is let as a stable and store, 1 has been fitted up by the tenant as a pig slaughterhouse, but is not used; 1 is let to the Public Health Department for the purpose of dealing with cases of emergency slaughter, etc., and 2 are used as cooling and sales rooms.

20 of the private slaughterhouses are registered

SECTION VI.

Miscellaneous.

Corporation Meteorological Observatory, Queens Park, Bolton.

THOS. MIDGLEY, F.R.Met.S.

The outstanding feature of the year 1923 was the excessive rainfall, only March and June having had falls below the month's average. The year's total, 57.031", was 13.781" above normal, and the highest since 1877. There were 247 rainy days, or 34 more than usual. Sunshine was registered on 260 days, 7 days more than the average. The total amount, 1025.1 hours, was 11 hours above the 37 year average. The average Barometer reading, 29.876" was one of the lowest on record, whilst the amount of cloud (0-10), 7.9, was the greatest recorded since 1887. Temperatures when averaged for the whole year differed very slightly from the normal.
